Landoll

5000 Series Grain Drills

**SEEDING
FLEXIBILITY**

PRECISE PLACEMENT FROM PRIMARY TO COVER CROPS

Many producers are making the switch to linear box affordability with the versatility to accurately plant high yielding primary crops as well as cover crops that produce valuable nitrogen and protect against soil erosion. Cover crops require the same seeding accuracy and depth control as primary crops. Achieving this requires the accuracy of the exclusive Fluted Seed Meter and the industry's first Pneumatic Down Pressure opener system. From 10' through 50' widths, the ruggedly built Landoll 5000 Series Drills deliver linear box affordability with unmatched standability.

Cover crops sequester carbons from the atmosphere and place them in your soils as valuable nutrients for your primary crop.

2022-2023 Wheat Crop Overview

wheat.okstate.edu

At the time of writing this report, 2023 Oklahoma wheat production is estimated to be approximately 54 million bushels, which is about 22% lower than 2022 production and 53% lower than 2021 production (Table 1). Approximately 4.6 million acres were planted for the 2023 crop year, larger than the 2022 crop but 4% lower than the previous 10-year average. Number of harvested acres is estimated at 2.15 million, which is 10% lower than in 2022 (Table 1). The statewide average yield is projected at 25 bu/ac. This is 3 bu/ac lower than the 2022 state average and 8 bu/ac lower than the previous 10-year average.

Table 1. Oklahoma wheat production for 2021, 2022, and 2023 as estimated by USDA NASS, June 2023.

	2021	2022	2023
Planted area (million acres)	4.4	4.3	4.6
Harvested area (million acres)	2.95	2.40	2.15
Yield (bushels/acre)	39	28	25
Total production (million bushels)	115	69	65

Dual-purpose wheat producers could not plant at the optimum time (mid-September) due to drought conditions in much of the state. Most of the wheat intended for dual-purpose was “dusted in” and emergence was delayed. Although dual-purpose wheat established well in some areas, October precipitation was insufficient to promote adequate fall forage production, and many producers were not able to graze the wheat in the fall. In some areas producers were able to use wheat for grazing in the spring with a lower stocking rate than usual. Oklahoma received rainfall in October, which helped the dual-purpose wheat to emerge and grow as well as enabled grain-only producers to plant under good soil moisture in some areas.

December was warmer than usual with large fluctuations in temperature and a few days below 32 degrees. By the end of year, the wheat was small and showing signs of drought stress and could have benefited from additional moisture going into the winter. However, this moisture did not arrive until February except in the NW and NC regions.

Due to a lack of moisture late in the fall, wheat fields planted late, especially the northcentral, northwest, and Panhandle regions, did not emerge until February. This resulted in reduced growth and tillering. The continual lack of rainfall during the winter made conditions unsuitable for wheat, and growers could not take the crop to grain harvest. Many producers decided to cut wheat for hay or had to abandon the fields. There were few dryland wheat fields harvested in the Panhandle. In other parts of the state where the crop was established in October and received some rainfall in February, April, and May, yield potential was acceptable. However, with the exception of eastern OK, much of the wheat in

the state was grown under chronic drought stress. No diseases or insects of any significance were observed in the fall.

Overall, average temperatures and extremely low rainfall resulted in small fall forage production (for more information see CR 2141 - Fall Forage Production and First Hollow Stem Date for Small Grain Varieties during the 2022-2023 Crop Year). Lack of moisture resulted in late wheat emergence, slow plant development, and delayed onset of first hollow stem for our region. This deficit also may have compressed differences among varieties for onset of first hollow stem. In the forage trials, the very early genotypes reached first hollow stem during the first week of March and most of the very late genotypes reached first hollow stem during the second week of March. By the end of March drought conditions became severe in many areas, and the crop was behind in growth in much of the state. Some parts of the state received decent rainfall at the beginning of April -- the most significant received since planting. This moisture saved many producers from not having a crop in 2023. However, some places, such as the panhandle and northwest regions, did not receive significant amounts of precipitation. Moisture deficit during this critical plant developmental stage (from jointing to flag leaf stage) resulted in short wheat in many fields. Flag leaves turned blue and curled due to lack of moisture. The weather continued to be very hot and dry and prevented the emergence of many diseases. However, moderate infestations of brown wheat mites occurred in the northern part of the state.

Wheat started to head by mid-April in southwest OK and late April in southcentral OK. Freeze events occurred but the damage was minimal this year. Some fields showed heads with discoloration (i.e., bleached) due to different types of stresses (e.g., freeze, drought, and crown/root rots). By May, the crop received significant amounts of precipitation, which was crucial to help with grain filling and test weight.

Late in March, wheat soilborne mosaic and wheat spindle streak mosaic were observed in a few research trials in Stillwater and Lahoma. Symptoms of these viral diseases disappeared as temperatures increased in April. In contrast to 2022, wheat streak mosaic was rarely observed and only a couple of infected samples were reported in Payne and Woods Counties late in March. Barley yellow dwarf, which is a common viral disease in Oklahoma, occurred at moderate incidence and severity during mid-April to mid-May.

As in 2022, common root rot (caused by *Bipolaris sorokiniana*) and *Fusarium* root and crown rot were severe throughout the growing season in multiple wheat fields in western Oklahoma where drought was prevalent. Root rots were observed in fields in multiple counties including Jackson, Woods, Kingfisher, Washita, Grant, Ellis, Grady, and Garfield.

Fungal foliar diseases were not noticeable until May due to severe drought. The precipitation in May promoted the development of some foliar fungal diseases, but it was late in the growing season to cause significant impact on yield. Among these foliar fungal diseases, spot blotch, *Septoria tritici* blotch, and *Stagonospora* leaf and glume blotch were observed in moderate incidence and severity with occasional fields showing high severity. These leaf spotting diseases were reported in Payne, Garfield, Major, Okmulgee,

Cleveland, and Grady counties. Powdery mildew was another foliar fungal disease that was observed in low incidence and severity in Payne and Okmulgee counties.

Stripe rust was first reported in low incidence and severity at the OSU South Central Research Station in Chickasha (Grady County) during the last week of April. Later in May, stripe rust was observed in trace levels at Stillwater (Payne County), but it was not a concern in Oklahoma wheat fields. The rainfall in May also favored the appearance of leaf rust that was observed in low incidence and severity at Stillwater and Lahoma. The highest incidence and severity of leaf rust were observed at the OSU South Central Research Station at Chickasha during mid- to late-May, with moderate to significant yield loss depending on resistance level. Leaf rust, however, did not appear to inflict widespread damage on the Oklahoma wheat crop. Stem rust, which is rarely observed in Oklahoma, was first reported at Chickasha during the third week of May. Stem rust hot spots were found on the wheat cultivar ‘LCS Galloway AX’ and a few other susceptible breeding lines from the Great Plains. Infected stem rust samples were sent to the USDA-ARS Cereal Disease Lab in Minnesota for race identification. The stem rust pathogen race was confirmed to be QFCSC which has been a dominant race in the USA for many years. This race was also found from earlier collections this year in Louisiana and Texas. There were no other reports of stem rust in Oklahoma wheat fields.

There were reports of nematodes and bacterial diseases in a few wheat fields in Oklahoma. During late March-early April, plant parasitic nematode species were recovered from a couple of soil and wheat samples collected from yellowing spots in wheat fields in Blaine and Ellis Counties. There were not many reports of nematode problems in wheat in Oklahoma in previous years, so future investigations will continue in coming seasons. Precipitation during May also favored the appearance of bacterial diseases including bacterial leaf streak that was confirmed in a sample from Morris (Okmulgee County). Bacterial leaf blight was observed in a couple of samples collected in Stillwater (Payne County) and Morris; however, this disease is not of major economic importance as the causal bacterium is considered a weak pathogen.

In summary, this year's crop was thin and short, with small head size due to the severe drought it experienced throughout the season. Kernel size, however, benefitted from precipitation events during May. Overall, the Oklahoma wheat crop was severely affected by lack of moisture, and some fields were not harvested.

Most of the rain in the state came in the first two weeks of May and continued until July. Consequently, harvest was delayed by a couple of weeks in some areas and weed pressure was problematic. According to the Oklahoma Wheat Commission report, grain yields of harvested wheat ranged from meager yields (10 bu/ac) in drought-stressed fields to higher yields (60-80 bu/ac) in intensively managed and irrigated fields. Test weight was good as harvest began, with values ranging from 58 to 61 lbs/bu. Wheat protein varied from 11 to 14% across the state, with a state average of 13%.

Testing Methods and Data Interpretation

wheat.okstate.edu

Testing Methods

Seed was packaged and planted in the same condition as delivered from the respective seed companies. Most seed was treated with an insecticide plus a fungicide, but the formulation and rate of seed treatment used was not confirmed or reported in this document.

Plots were seven rows wide with 7.5-inch row spacing and were sown with a Great Plains no-till drill modified for cone-seeded, small-plot research. Except for dryland locations in the Panhandle, plots were planted 25 feet long and trimmed to 19 feet at harvest with the plot combine. Panhandle dryland locations were 35 feet long at planting and trimmed to 29 feet at harvest. Wheel tracks were included in the plot area for yield calculation for a total plot width of 60 inches. The experimental design for all sites was a randomized complete block with four replicates. The intensive management trials at Apache, Morris, Chickasha, and Lahoma received two fungicide applications, additional topdress nitrogen application in the spring, and were planted on a seeds per acre basis at 1.2 million seeds per acre. Fungicide was applied at Feekes 6 (jointing) and Feekes 9 (flag leaf completely emerged). Additional information on product name, rate and date of application is included in the tables for the respective sites.

Plots received 5 gal/ac of 10-34-0 at planting. All variety trial locations were sown at 60 pounds per acre, except for the dual-purpose trials at El Reno and Walters, which were sown at 120 pounds per acre.

The intensive wheat management trials at Apache, Chickasha, Lahoma, and Morris were sown at 1.2 million seeds per acre. Grazing intensity, nitrogen fertilization, and insect and weed control decisions were made on a location-by-location basis and reflect standard management practices for the area. In general, the spring-applied N rate was calculated for a 70 bu/ac yield goal for the standard management trials and 100 bu/ac yield goal for the intensive management trials.

Plots were harvested with a Winterstieger Delta small plot combine. Grain weight, test weight, protein concentration, and moisture content were collected from each plot, and grain yields and protein concentration were corrected to 12% moisture content. Grain moisture at all sites was generally below 12%, and maximum and minimum grain moisture for all plots at a location typically ranged no more than 2%. Similar to many wheat fields in the region, the Hooker trial experienced severe drought stress throughout the growing season, with significant plant mortality. Thus, this site was not harvested in 2023.

Data Interpretation

Yield, test weight, and protein data for each location and regional summary were analyzed using the appropriate statistical methods. At the bottom of each table, the mean and least significant difference (LSD) values are reported. The LSD is a test statistic that aids in determining whether there is a true difference in yield,

test weight, and protein. In this report, one can be 95% confident that the difference between two varieties is real if the difference is greater than the LSD value. Data that is not significantly different is indicated by "NS". For example, if the LSD value is 4 bu/ac in a trial where Variety A yielded 30 bu/ac and Variety B yielded 25, then Variety A would be considered to have a statistically higher yield. However, if Variety C yielded 27 bu/ac, then Variety A and Variety C would be considered to have a similar yield. In that same example trial, there is a 5% chance that the 4 bu/ac difference between Variety A and Variety B does not truly exist, but random chance caused the 5 bushel difference. These chance factors may include differences in fertility, moisture availability, and diseases. To aid in visualizing the varieties with the highest yields, test weights, and proteins, values highlighted in gray do not differ statistically from the highest value within a column. The performance of a variety may vary from year to year, even at the same location. Tests over two or more years and over multiple locations more accurately predict the performance of a variety.

LSD (0.05)		5	4	8	2.1	1.0

Notes: Grain yield and protein concentration were adjusted to 12% moisture content. Shaded values were not statistically different from the highest value within a column. The crop experienced severe drought stress during the season and moderate pressure of weeds at the end of the season. The weeds present were Buckwheat, Buffalo Bur, Crabgrass, Downy brome, Foxtail, Johnson grass, and Kocia. Double-dashes"--" = data not available.

Apache Intensive Wheat Management Variety Trial

wheat.okstate.edu

Cooperator: Bryan Vail

Planting & harvest dates: 10/14/2022 & 06/09/2023

Management: Grain-Only, conventional tillage

Seeding rate: 1.2 million seeds/acre

Nitrogen: 6 lbs/acre 10-34-0 and 75 lbs/ac around 01/25/23

Fungicide: 2 fl oz/ac Tebucure 3.6 at jointing on 03/23/23 and 7 fl oz/ac MiCrop at flag leaf-boot stage on 04/12/23

Extension Educator: Alyson Pitmon

Previous crop: Wheat

Soil Type: Hollister silt loam

Soil test: pH=5.5, N= 103, P= 37, K= 336

Notes: Grain yield and protein concentration were adjusted to 12% moisture content. Shaded values are not statistically different from the highest value within a column. This is the second year we have conducted an intensive management trial at Apache. For this reason, there is no data to calculate 3-year average. Butler's Gold late-planted was planted on 12/06/2022. There were no diseases observed and the crop was impacted by a drought stress during the season. Double-dashes"--" = data not available.

Mean		39	20	65	58.3	16.5
LSD (0.05)		7	3	5	0.9	1.3

Notes: Grain yield and protein concentration were adjusted to 12% moisture content. Shaded values are not statistically different from the highest value within a column. There was severe drought stress during the season. In 2021-2022, there was severe drought stress, and high pressure of brown wheat mites and fusarium root rots. In 2021-2022, we utilized a different statistical analysis for grain yield, test weight, and protein to reduce the impact of the spatial variability possibly caused by heavier fusarium root rots infestation on the north side of the experiment. Therefore, data from previous years will not be combined with the current year to provide long-term averages. Double-dashes"--" = data not available.

Notes: Grain yield and protein concentration were adjusted to 12% moisture content. Shaded values were not statistically different from the highest value within a column. The crop experienced drought stress during the season and received a few timely rains in the spring, which enhanced realized yield in this particular environment relative to the statewide yield average. The rainfall events that occurred during the grain filling period resulted in increased pressure of Leaf rust and Septoria fungal diseases. Leaf rust was rated utilizing the Coefficient of Infection (CI) method. Coefficient of Infection = Severity (%) * Constant for infection response. The greater the value the more susceptible a variety is to leaf rust. Double-dashes"--" = data not available.

Chickasha Regional Intensive Wheat Management Variety Trial

wheat.okstate.edu

Cooperator: OSU South Central Research Station
 Planting & harvest dates: 10/21/2022 & 06/07/2023
 Management: Grain-only, conventional tillage
 Seeding rate: 1.2 million seeds/acre
 Nitrogen: 6 lbs/ac 10-34-0 at planting, 80 lbs/ac on 2/20/23 and 60 lbs/ac on 3/15/23
 Extension Educator: Denise Wood
 Previous crop: Austrian winter peas
 Soil Type: Dale silt loam
 Soil test: pH=6.6, N= 56, P= 35, K= 221
 Fungicide: 2.6 fl oz/ac Tebucure 3.6 at jointing on 3/23/23 and 8.6 fl oz/ac Nexicor at flag leaf-boot stage on 4/12/23

Mean		42	49	53	8
LSD (0.05)		9	7	10	--

Notes: Grain yield was adjusted to 12% moisture content. Shaded values were not statistically different from the highest value within a column. The grain-only trial was planted and emerged much later than the optimal time due to lack of moisture in the fall. The late emerged and unacclimated wheat experienced very cold temperatures in late December and early February, which may have differentially reduced spring tillering ability among varieties. Also, freeze injury was not determined in March, which could have accounted for the uncharacteristic declines in grain yield between the dual-purpose and grain-only trials. These differences, therefore, should not be interpreted simply as a response to grazing or no grazing. There was high to moderate pressure of weed infestation across the trial. The weeds present were Wild Buckwheat, Jointed Goatgrass, Italian Ryegrass, and Rescuegrass. Most of them appeared after the rain events in late April and May. Weed pressure was assessed by estimating the percent of weed seeds within a sample. Due to the presence of weed seeds in the grain-only samples, test weight and grain protein concentration were not measured. Double-dashes"--" = data not available.

Notes: Grain yield and protein concentration were adjusted to 12% moisture content. Shaded values were not statistically different from the highest value within a column. Dual-purpose plots were grazed from 01/8/23 to 03/1/23 at an average stocking rate of 206 pounds of animal BW per acre.

The grain-only trial was planted and emerged much later than the optimal time due to lack of moisture in the fall. The late emerged and unacclimated wheat experienced very cold temperatures in late December and early February, which may have differentially reduced spring tillering ability among varieties. Also, freeze injury was not determined in March, which could have accounted for the uncharacteristic declines in grain yield between the dual-purpose and grain-only trials. These differences, therefore, should not be interpreted simply as a response to grazing or no grazing. There was high to moderate pressure of weed infestation across the trial. The weeds present were Wild Buckwheat, Jointed Goatgrass, Italian Ryegrass, and Rescuegrass. Most of them appeared after the rain events in late April and May. Weed pressure was assessed by estimating the percent of weed seeds within a sample. Due to the presence of weed seeds in the grain-only samples, test weight and grain protein concentration were not measured. Double-dashes"--" = data not available.

Notes: Grain yield and protein concentration were adjusted to 12% moisture content. Shaded values were not statistically different from the highest value within a column. The crop experienced severe drought stress during the season and severe pressure of Pigweed at the end of the season. In 2022, there was no harvest results from this location. Thus, 2-year and 3-year averages represent results from 2023, 2021, and 2020 harvest years. Double-dashes"--" = data not available.

Note: The seeding rate column "Grain-only standard management" represents the number of seeds per acre for each variety when planted at 60 pounds per acre. Thus, seeding rate was estimated by multiplying the amount of seeds per pound by 60 pounds per acre per variety. The reported seeds per pound reflect only the seed source used to plant the 2023 trials and may not approximate the long-term average for a given variety. All variety trial locations were sown at 60 pounds per acre, except for the dual-purpose trials at El Reno and Walters that were sown at 120 pounds per acre and the intensive wheat management trials at Apache, Chickasha, Lahoma, and Morris that were sown at 1.2 million seeds per acre.

Lumivia[®] CPL

INSECTICIDE SEED TREATMENT

Protect your wheat from roots to shoots

With a unique mode of action, Lumivia[®] CPL insecticide seed treatment starts protecting seed immediately, helping to establish a strong stand and better yield potential. Only Lumivia CPL moves through the plant both above and below ground.

Learn more at corteva.us/lumiviapl

[™] [®] Trademarks of Corteva Agriscience and its affiliated companies. Lumivia[®] CPL insecticide seed treatment is not registered for sale or use in all states. Contact your state pesticide regulatory agency to determine if a product is registered for sale or use in your state. **Add an EPA-approved dye or colorant to treat the seeds per 40 CFR 153.155(b)(1) during the seed treatment process.** Ensure that all treated seed are dyed an unnatural color. Always read and follow label directions. © 2023 Corteva.

FIELD INSPECTION

APPLICATION INFORMATION:

APPLICATION (Deadline) DATES:

December 31 (**due date**) March 1st (**deadline**) – Small Grains
No applications will be accepted after March 15th

March 1: Turfgrasses

April 15: Weeping Lovegrass, Cool Season Grasses

June 15 (**due date**) August 1 (**deadline**) – Peanuts

August 1: Cotton, Cowpeas, Mungbeans, Okra, Soybeans,
 Warm Season grasses, Sorghum

September 1: Vegetatively propagated forage grasses

In all cases, any field harvested before inspection is done will have NO recourse for completing certification.

NOTES:

Two weeks prior to desired inspection – Alfalfa and other crops when this date is earlier than the established deadline. The Association assumes no obligation to inspect fields unless an application is filed prior to the deadline date, shows the fields to be eligible, and is accompanied by required fees.

MAILING ADDRESS

OCIA

2902 W 6th Ave ▪ Stillwater OK 74074-1555

INSPECTION FEES:

CROPS VARIETY	VARIETY AND ACREAGE FEES PER
•small grains	\$15.00 per variety plus \$3.50 per acre up to and including 1,000 acres per variety then \$3.00 for each acre over 1,000.
•cotton, soybeans, sorghum, mungbeans, vetch & millet.	\$15.00 per variety plus \$3.25 per acre up to and including 1,000 acres per variety then \$2.50 for each acre over 1,000.
•alfalfa, clover, peanuts, grasses, okra, and sweet potatoes.	\$15.00 per variety plus \$3.75 per acre up to and including 1,000 acres per variety then \$3.00 for each acre over 1,000.
•turfgrass	\$1000 application fee, \$20.00 per acre up to 20 then \$10.00 for each acre over 20.

\$100.00 Annual Applicant Fee

NOTES:

A round trip mileage fee at the current IRS rate per mile will

SEED SAMPLING AND TESTING

No matter how accurate the seed analysis, it reveals only the quality of the sample submitted. It is important, therefore, that certain procedures be followed in collecting seed samples for testing purposes which most nearly represent the bulk of the seed in a given lot.

A. General procedures:

1. Take equal portions from evenly distributed parts of the quantity of seed to be sampled.
2. For free-flowing seeds, use a probe or trier long enough to sample all portions whether seed is in bags or bulk.
3. For non-free-flowing seed, such as chaffy seeded grasses, thrust the hand into the bulk and withdraw representative portions.

B. Obtaining a representative sample for laboratory analysis:

1. When more than one core or handful is drawn, follow different paths.
2. For lots of one to six bags, obtain a sample from each bag.
3. For lots of more than six bags, sample five bags plus at least 10% of the number of bags in the lot. Regardless of the lot size, it is not necessary to sample more than 30 bags. For example, seed lots consisting of 7, 100 and 400 bags, each would require 6, 15, and 30 bags to be sampled, respectively. For bulk seed, a composite sample may be obtained by taking many cores or handfuls as if the same quantity of seed were in bags of an ordinary size. Take samples from well distributed points throughout the bulk.
4. For samples taken during cleaning/conditioning sub samples should be taken

SUBMITTING SEED SAMPLES

All certified seed must be cleaned by the grower or by an Approved Conditioner and a representative sample of each cleaned lot of seed must be submitted to the OCIA Designated Laboratory for analysis. If seed is to be treated prior to marketing, both treated and untreated samples must be submitted. The treated sample must be labeled "TREATED" and must show the kind of chemical treatment used.

SEED SAMPLE LABELING REQUIREMENTS

Form C "Request for Testing and Certificate of Inspection" must be sent to the OCIA office for all samples submitted for testing.

SIZE OF SEED SAMPLES

Crop kind and amount of seed to submit for testing is as follows:
 Weeping lovegrass, bluestem, bermudagrass, other grass seed. 1/2 pound
 Alfalfa, millet, peanut (treated 1 pound
 Peanut (untreated 1 1/2 pound
 Cotton, cowpea, guar, mungbeans, okra, small grains, sorghum, soybean 2 pound

Mail your sample to:

Laboratory shown on the sample bag

Mail Form C to:

Oklahoma Crop Improvement Assoc.
 2902 W 6th Ave
 Stillwater OK 74074-1555

DAN HERALD FARMS

Certified Seed Sales

Large Heavy Seed

Breakthrough

New OSU release with Mosaic resistance in a high performance variety.

TAM 115

Texas A&M breed variety for the panhandles with greatly improved straw strength. Performs well under irrigation while retaining the toughness of its parent, TAM 112.

TAM 204

Beardless dual-purpose wheat with strong disease package.

TAM 112

Excellent dryland producer, proven to perform with outstanding drought tolerance.

IBA

Last year's Texas County Dryland Trial winner with extreme yield potential under irrigation.

Oklahoma, Put a Good Coat On Your Winter Wheat

Defend against drought stress
and strengthen vital nutrient uptake
with proven biological products

biotrinsic® W13
WP

WHEAT
DROUGHT

BIENEFICIAL MICROBES

biotrinsic® WN29

WHEAT

BIENEFICIAL MICROBES

biotrinsic® W13

Improve drought tolerance by optimizing root growth and increasing water uptake

biotrinsic® WN29

Increase nutrient uptake in stressful conditions, and save an average 17 lb/a of Nitrogen

“We tested Indigo’s biological treatment on 300 acres of wheat to start. It was a night and day difference. 10 bu/a more than our untreated fields. It even bumped up our variety’s protein content, which netted us a 37 cent premium. Next year, guess what we did? Put that seed treatment on all our wheat, and row crop acres too.”

Jon Johnson, Farmer

Find your local retailer.

Indigo does not guarantee any specific outcomes. A wide range of variables affect product performance, your results may vary. Additional terms, conditions and limitations may apply. Product may not be available in all areas.

LCS is the CoAXium® leader, with more CoAXium varieties available and acres planted than anyone in the market.

LCS Photon AX

Ideal grazer. Strong test weight and protein. Performs well in dryland conditions.

LCS Atomic AX

Early with quick emergence, strong straw, reliable yields. Great for grazing and low pH.

LCS Helix AX

Intensive management chasing top-end yields. Excellent disease package.

LCS Steel AX

Latest maturing CoAXium with strong straw and standability. Excellent for grazing.

HIGHER YIELDS START WITH HIGHER QUALITY SEED

- High Yield Record - 80 to 100 bushels
- Good Fall Forage Potential
- Good Stripe Rust Resistance
- Outstanding Mill and Bake Quality
- Good Aluminum Tolerance

- Excellent Leaf and Stripe Rust Tolerance
- Good Fall Forage Potential
- Good Straw Strength
- Excellent Soil Borne Mosaic Tolerance
- Good Grazing in Southern/Eastern KS

Uncleaned

Cleanout

POLANSKY PURE

The combination of the air screen cleaner, length grader, gravity table, color sorter and magnets removes impurities, including white caps, that can plug air seeders and reduce yield.

Belleville, KS

KNOW THE LAW

Replanting Patented seed is illegal.

It's important to know the facts when it comes to saving and replanting seed.

Remember:

Patented seed cannot be replanted without the patent owner's permission.

All Roundup Ready® seed is patented. Seed protected by the Plant Variety Protection Act (PVPA) might include a public variety that does not contain a value-added trait.

PVPA-protected seed can only be used for seed by the grower who originally purchased the seed.

People who help growers save patented seed for replanting can also be found to have infringed patents and be held liable.

Please – follow the law for your benefit and ours.

How Can I Become A Certified Seed Grower?

Seed Certification is open to all who wish to participate. Seed Certification is the process required to produce high quality pedigreed seed. It is in effect the same type of system that the major seed companies use to ensure that the grain producer is getting high quality seed.

Certified seed is a limited generation seed production system. Each time that you produce a class of certified seed you start with fresh clean seed. This process insures that problems with varietal purity, weed and other crop seed will be a limited factor. Foundation seed produces Registered seed, Registered seed produces Certified seed and Certified seed produces grain.

There are several basic requirements to become a certified seed producer. First you need to buy eligible seed. If you are going to produce Certified seed you will need to purchase Registered seed. This seed needs to be planted on clean ground, ground that has not produced a like crop in the past year or has been planted to the same variety of certified seed in the past year. For example, if you are going to produce Certified Duster you will need to purchase Registered Duster and plant it on ground that was not in wheat the previous year or was planted with Certified seed to produce grain. This insures that there will be no contamination by other varieties of wheat.

After you have selected the variety and have selected clean ground you will need to submit an application to the OCIA office.

Applications are now submitted online. You will need to contact the OCIA office for complete instructions. Next you will need to prepare your field for inspection by OCIA. This involves removing any impurities such as rye which may have been spread by birds or fertilizer applications and controlling any noxious weeds such as field bindweed. Isolation also needs to be determined at this time. In wheat there needs to be 10 feet between a certified seed field and other wheat. This area may be a ditch, fence row or it can be harvested for grain and taken to the elevator.

Next field inspection will occur, the inspector will contact you prior to harvest to make you aware that he will be in the area and that your field is ready for inspection. After inspection is completed you will receive a copy of the field inspection report.

DO NOT harvest your field before you have been notified that your field has been inspected and has been approved for certification. Check your *myFields* account for the status of your field inspection and review the inspector's report. If you have not been notified by the inspector or your field is still listed as "pending" on *myFields*, call the OCIA office immediately before cutting. Fields that have been harvested prior to inspection are **NOT** eligible for certification.

This is followed by seed conditioning. Seed conditioning removes broken seed

and chaff along with any weed seed that may be present. This can either be done by an approved conditioner listed in the directory or with your own seed cleaning equipment.

After cleaning has been completed or in process a sample of seed will need to be sent for testing. This will provide you with all the necessary information for the label requirements and ensure that the seed meets OCIA standards. At this point if everything has met standards you have completed certification. You will need to order tags for either bags or to be used with bulk sales.

Before the seed is sold you will need to purchase a seed dealer's license from Oklahoma Department of Agriculture.

If you are interested in becoming a certified seed grower please contact the OCIA office.

Oklahoma Crop Improvement Approved Conditioners 2023

All certified seed which is conditioned must be conditioned by the grower or one of the Approved Conditioners listed below. If the seed is conditioned by a firm other than an Approved Conditioner, it will automatically lose its rating as certified seed.

P — Portable Cleaners

B — Bulk Facility

Interested in Becoming a Bulk Retail Facility?

Becoming a Bulk Retail Facility allows you to sell Certified Seed in bulk, providing your customers with a readily available source of high quality seed. If you or your company is interested in becoming a bulk seed retail facility you will need to contact OCIA. Such a facility may be part of a seed conditioning plant or the facility may be approved for handling bulk seed only. This will require that you fill out an Approved Bulk Retail application and have an inspection completed before selling Certified Seed in bulk.

You will need to provide your customers with a Seed Sales Acknowledgement with appropriate seed label affixed to the front of the form (PVP)

Certified Seed Labels **must** be purchased from OCIA. This allows your facility to sell certified seed that has been purchased from certified seed growers. It also ensures that your customers are getting the appropriate variety as a class of certified seed.

Seeding Success Starts Here.

The BD7600 Box Drill from Great Plains is a truly revolutionary seeding solution.

The legendary BD7600 features industry-leading box capacity, a durable, field-tested design, and an innovative metering system for greater accuracy across most seed types, from traditional to cover crops. Add DrillCommand® and hydraulic drive to execute variable-rate and prescription mapped seeding effortlessly from the tractor cab.

Visit your local dealer or
GreatPlainsAg.com to learn more.

Easy-to-transport Models Range in Working Widths from 26' to 50'
